It is possible that a certain file in the bucket was deleted and now it is not present anymore. I need to catch these exceptions so that I can react accordingly and maybe upload the file. I am not using any services as a target for the exception. I just use S3 as a storage and allow users to upload files. I have used the S3 API Explorer to create a bucket and create some objects in it. And then I try to delete one of those objects, which I don't really have the file anymore. I see that the method is successful and the object still exists. I don't know why it is that successful as the object is not there. Does anybody have an idea what I can do in order to catch the exception? The following code is the part that creates the file. try { \$result = \$s3->create_object(\$bucket, \$object, array('content' => \$file, 'acl' => 'public-read')); \$result->get_object_acl(); } catch(S3Exception \$ex) { \$message = \$ex->getMessage(); } Thanks in advance for your help. A: I assume that you are using an "old" S3 PHP library and that the method you use is a non-standard one. If so, the method you are calling might be throwing the exception, not just returning false if the object doesn't exist. In this case, it's up to you to catch and handle the exception. It might also be possible to use an alternative PHP library which handles the exceptions for you. The S3 PHP library you are using is
